

Coronavirus and Living with HIV

HIV positive and NOT on treatment

If you are HIV positive and NOT on treatment, you will be among the most at risk because of weakened immunity.

HIV positive and on treatment

HIV positive patients on treatment and whose viral load is suppressed, their response to the disease will not be different to how an HIV negative patient's response would be. Continue taking treatment to ensure that your viral load is suppressed.

Know your HIV status

People who are HIV positive and not yet diagnosed, should be concerned about how they would respond to the disease. It is important to get tested and start treatment.

Now is the time to know your HIV status and start treatment.
